TRANSMITTAL OF "WORKING DRAFT" STUDY REPORT: UTILITY RATES & CHARGES STUDY: WATER, SEWER AND STORM SYSTEMS

Dear Mr. Konkel.

FCS GROUP is pleased to submit a working draft of the rate study findings. This document is not intended as our project deliverable, but simply as a guide to aid the Committee in its review and evaluation of the study process and results. FCS GROUP plans to attend the next Committee meeting (October 29), at which time we will be happy to review the document with the Committee and address questions and/or concerns.

As you are aware, City staff just provided us with requested revisions to some of the financial assumptions used in the current analysis. Due to the Committee's request for documentation in advance of this meeting, we have not yet incorporated this new information. We will finalize the analysis and submit a final study report following further direction from the City.

Any questions regarding this report can be directed to me at (425) 867-1802, ext. 241, or send email to karynj@fcsgroup.com.

Sincerely,

Karyn Johnson **Principal**

Samantha Holert **Project Consultant**

SECTION 1 STUDY FRAMEWORK

A. Introduction

In 2008, the City of Bainbridge Island authorized FCS GROUP to complete a Utility Rates & Charges Study for its Water, Sewer, and Storm Systems. The purpose of this comprehensive rate study was to assist the City in maintaining financially stable utilities and to promote a fair and equitable allocation of costs to customers. The scope of this study included the following major elements:

- Data collection / validation
- Fiscal policy evaluation
- System participation fee development
- Capital financial planning analysis
- Revenue requirement forecast
- Cost of service / rate structure evaluation
- Meetings & documentation

These scope elements are addressed throughout each section described in this report.

B. METHODOLOGY

In analyzing and determining rate and charge structures, there are four fundamental analyses performed: a System Participation Fee Analysis, a Revenue Requirement Analysis, a Cost of Service Analysis; and the Rate Design. The methods used to complete our work are based on analytical principals that are generally accepted and widely followed throughout the industry - rates and charges must generate enough revenue to maintain self-supporting and financially viable utilities without undue discrimination toward or against any customer.

This study process, which evolved over a period of about one year, involved several iterations of data analyses and the development of scenarios for rate and charge increase strategies and customer class rate structures. Several meetings were held with City staff to validate input parameters, review interim findings, and receive policy direction. In addition, several workshops were held with the City Council to evaluate findings and arrive at rate and charge implementation strategies consistent with City policy objectives.

C. REPORT ORGANIZATION

The following sections provide an overview of the major analytical methods employed by FCS GROUP to complete this work, as well as study findings and

recommendations. The remainder of this report provides separate sections for Policy Development (Section 2); System Participation Fees (Section 3); Revenue Requirements (Section 4); Cost of Service Analysis (Section 5); and Rate Design (Section 6). The Technical Appendix contains the analytical detail supporting the analysis for each utility.

Section 2 Policy Development

The purpose of establishing financial polices for the City's utility enterprises is to promote the financial integrity and stability of the utilities and help ensure the sustainability of essential utility services. These policies form the foundation of utility management and, with routine application, can act as overarching guidelines for consistent decision making.

Some financial policies are literally imposed by outside influence (minimum debt service coverage, bond reserves, and regulatory guidelines) while other policies are specific to the agency and its utilities (discretionary reserve levels, reinvestment protocols, use of debt). In an attempt to provide consistency to rates and the rate setting process in the future, our study provides recommended policies that should help the City achieve financial and rate stability from year-to-year. In developing the financial plans, we have incorporated the following fiscal policies.

A. FUND ACCOUNTING

From an industry and financial management perspective, cash balances are a necessary and appropriate part of prudent utility management practices. Within each utility enterprise, appropriate segregation of monies should be established and maintained to provide adequate controls as to the sources and uses of funds. This practice helps to ensure that funds raised through each utility are applied to the appropriate purposes, and that equity attained through rate and charge structures is maintained in application. Above all, the City should establish and maintain a financial structure that provides for adequate and predictable revenues to meet the forecasted needs and operational, legal, and policy objectives of the water, sewer, and storm systems.

The rate management strategy presented in this study presumes that each utility will continue to operate as a self-supporting enterprise fund. This means, utility-specific rates and charges have been designed to recover the forecasted costs and financial obligations of each utility — without subsidy between the three utilities, and without subsidy from other City general fund revenue sources, such as property taxes.

1. Operating Reserves

An operating reserve is designed to provide a liquidity cushion to help ensure financial viability of the utilities despite short-term variability in revenues and expenses, primarily caused by seasonal fluctuations in billings and receipts, unanticipated cash operating expenses, or lower than expected revenue collections. Target funding levels are generally expressed in number of days' operating and maintenance (O&M) expenses, with the minimum requirement varying with the expected risk of unanticipated needs or revenue volatility. For this study, operating

reserve targets have been established at 60 to 90 days for each utility. Consistent with industry practice, the higher target for the water utility is to safeguard against the increased variability in revenue collections resulting from discretionary water use in the summer period. Conservation-based rate structures can increase revenue instability due to a greater reliance on revenues from the volume charge component — which is more susceptible to changes in customer use and weather patterns.

The Operating Reserve target should be as of December 31^{st} of each calendar year, with the balance expected to vary during the course of the year. Generally, in any year where operating reserves exceed the maximum target, we recommend using the excess cash to help pay for capital projects. This can be accomplished by calculating the target balance at year end (e.g. 90/365 x actual O&M expense for the year) and comparing it against the actual ending cash balance. If the actual balance is greater than the target, transfer the difference to the respective utility Capital Account. The rate management strategy presented herein complies with the above established target balance threshold for each utility.

The City does not currently hold operating and capital cash in separate accounts. Therefore, beginning 2009 cash balances were first allocated to the operating utility based on need. The remainder was assigned to the capital fund beginning balance.

Based on these beginning 2009 allocations, the operating reserve was \$0 for the water utility, increasing to about \$413,000 by the end of the six-year study period. For the sewer utility, the reserve began at about \$820,000, reducing to about \$503,000 by the end of the study period. The reserve for the storm utility began at about -\$11,000, increasing to about \$461,000 by the end of 2014.

2. Capital Contingency Reserves

A Capital Contingency Reserve is an amount of cash set aside in case of an emergency, should a major piece of equipment or a portion of the utility's infrastructure fail unexpectedly. Additionally, the reserve could be used for other unanticipated capital needs or capital cost overruns. These reserves are not intended to cover the cost of system-wide failures resulting from catastrophic events; a more common practice is to carry property and casualty insurance for such purposes. The Capital Account holds debt proceeds, system participation fee revenues, system reinvestment funding from rates, and any transfers of cash reserves from the Operating Account.

The capital reserve does not have a direct impact on rates. It is essentially "nested" with the policy to fund annual system reinvestment from rates, meaning, the 1% capital reserve is met by the system reinvestment funding monies transferred from the operating account to the capital account. For this study, we assume that cash from rates for system reinvestment funding and surplus cash from the Operating Account will be transferred to the Capital Account at year's end and become available for capital use in subsequent years.

Common industry practice is to maintain a minimum balance in the Capital Account equal to 1% to 2% of system fixed assets. The rate management strategy presented herein complies with the above established target balance threshold for each utility.

Based on the current fixed assets and planned capital additions for the utilities over the study period, the recommended contingency reserve for the water utility is forecasted to reduce from \$3.7 million to \$548,000 by the end of study period, from \$371,000 increasing to \$502,000 by the end of the study period for the sewer utility, and from \$0 to \$236,000 by the end of 2014 for the storm utility – well within industry standards.

3. Restricted Debt Reserves

When issuing revenue bonds (and some other types of debt), underwriters require the municipality to establish and maintain a restricted cash reserve for the utilities through the term of debt repayment. The purpose of a debt reserve is to provide one safeguard for bondholders, in the event the utilities have insufficient funds to meet annual debt service (i.e., scheduled principal and interest payments). This reserve is generally equal to one year's debt service payment for each bond issue. The reserve can be used to fund the last year's debt service payment for each issue.

The City historically has issued limited tax general obligation bonds (LTGO bonds) and taken out Public Works Trust Fund (PWTF) loans to finance utility system capital needs. Based on the direction of City staff, the rate management strategy presented in this study conservatively presumes that the City will use revenue bonds for any future debt-financing needs.

Revenue bonds are a more secure financing mechanism for utility needs and commonly used to fund utility capital improvements. The debt is secured by the revenues of the issuing utility (or combined utilities) and the debt obligation does not extend to the City's other revenue sources. With this limited commitment, revenue bonds typically bear higher interest rates than GO Bonds and also require security conditions related to the maintenance of dedicated reserves and financial performance (added bond debt service coverage). Revenue bonds can be issued in Washington without a public vote. There is no bonding limit, except perhaps the practical limit of the utility's ability to generate sufficient revenue to repay the debt and provide coverage. In some cases, poor credit might make issuing bonds problematic.

Since revenue bonds require a debt reserve, additional reserves have been incorporated for each future bond issue (assumed to be funded with debt proceeds equal to one year's principal and interest payment). The City will continue to pursue the lower cost state loans to reduce future bond financing requirements.

B. System Reinvestment Funding

The phrase "system reinvestment funding" refers to the practice of setting aside cash revenues from rates each year to help provide for the replacement of aging system

facilities to ensure sustainability of the system for ongoing operations. A common approach of municipal utilities is to establish a policy of system reinvestment funding through rates using depreciation expense as the benchmark for the appropriate level of funding.

Annual depreciation is a non-cash expense intended to recognize the consumption of utility assets over their useful lives, using original cost. Depreciation expense is calculated as the original cost of each asset divided by its estimated useful life, usually derived from published accounting tables by type of asset. For the rate analyses, we started with the actual depreciation expense recorded on financial statement for 2008. For each subsequent year of the forecast period, we then added depreciation expense for the capital assets planned to be constructed by year. Depreciation expense is assumed to begin in the year following the year of capital construction. For example, if a facility is constructed in 2010, depreciation expense for that asset begins in 2011.

Collecting the amount of annual depreciation expense through rates provides a funding source for capital expenditures, especially those related to repair and replacement of existing utility plant. Further, funding depreciation through rates helps to ensure that existing ratepayers pay for the use of the assets serving them (rate equity), with the cash flow funding at least a portion of the eventual replacement of those assets. It is important to note that depreciation is not equal to the future replacement cost of the utility systems, but serves simply as a starting point for addressing long-term replacement needs. Actual system replacement costs will be significantly higher than the cost originally incurred to build the systems.

As an alternative to full depreciation funding, depreciation funding net of outstanding debt principal is sometimes used as a relatively moderate replacement funding strategy. Using this approach, the full funding of depreciation is seen as having two uses: first, reducing liabilities by paying debt principal as due, and second, generating a cash asset for system reinvestment. Debt reduction, cash accumulation, or both thereby offset depreciation. This "net debt funding" benchmark is roughly equivalent to "break-even" performance from a balance sheet perspective.

The annual funding is assumed to be transferred from the operating account to the capital account at year-end, and available to help pay for capital expenditures in the following year. Based on City staff direction, the rate management strategy presented in this study provides for system reinvestment funding for each utility as follows:

Water Utility –100% of annual depreciation expense net of annual debt principal payments is funded. Water system annual depreciation expense is currently about \$344,000, reaching \$528,000 by the end of this study period. Funding depreciation net of debt principal payments will vary from year to year, ranging from \$231,000 to \$428,000. This funding level does not have any impact on rates during the study period.

- Sewer Utility Due to the substantially higher debt load for the sewer utility, fund 100% of annual depreciation expense net of annual debt principal payments. This serves to avoid overly burdening existing ratepayers with the payment of debt and funding for future asset replacement at the same time. Sewer system annual depreciation expense is currently \$461,000, reaching \$936,000 by the end of this six-year study period. Since annual debt principal payments are higher than the annual depreciation expense throughout the study period, the rate funded system reinvestment is \$0 from 2009 to 2014 and thus rates are not impacted.
- Storm Utility 100% of annual depreciation expense net of annual debt principal payments is funded. Storm system annual depreciation expense is currently about \$281,000, reaching \$341,000 by the end of this study period. Funding depreciation net of debt principal payments will vary from year to year, ranging from \$0 to \$218,000. This funding level does not have any impact on rates during the study period.

C. DEBT SERVICE COVERAGE REQUIREMENTS

When a municipality issues revenue bonds (and other types of debt instruments), it agrees to certain terms and conditions related to the repayment of those bonds. One of those terms is referred to as bond coverage. Simply put, the agency agrees to collect enough in annual revenues to meet all operating expenses (net of internal utility taxes) and not only pay debt service, but actually collect an additional multiple of that debt service. Bond coverage ratios typically range from 1.10 to 1.50, meaning that the agency would collect expenses plus 1.10 to 1.50 times revenue bond debt service as a minimum legal level of revenues. The stated coverage factor is a minimum requirement — meaning anything less than this level would be a technical default of the bond covenant.

The rate management strategy presented for this rate study applies a coverage test of 1.25, including the use of SPF revenues. Revenue generated above cash needs to comply with coverage requirements may be used for capital purposes, and thus reduce future borrowing needs.

D. USE OF SYSTEM PARTICIPATION FEES FOR DEBT SERVICE

System Participation Fees are derived from new development rather than from the existing customer base, and are thus subject to wide fluctuations. The City should estimate and budget SPF revenues based on long-term growth estimates, recent growth experience, and the scale of known development planned or underway. The purpose is to establish a reasonable and conservative estimate of potential SPF revenue collections.

SPF revenue should be deposited in the Capital Account of each utility and made available for capital purposes only. SPFs can legally be used in two ways — they can be applied to project costs directly (reducing the amount of debt issued), or they can be applied toward annual debt service payments. FCS GROUP recommends that, as

a general policy, SPF revenues be used to directly fund capital expenditures, and this rate management strategy has been incorporated into these analyses.

E. CAPITAL PROGRAM FUNDING / DEBT MANAGEMENT

In conjunction with establishing or planning its capital program, the City should develop a corresponding capital-financing plan that supports execution of that program. This program should incorporate system replacement and rehabilitation, system upgrade and improvement, and system expansion. The policy intent is to establish an integrated capital funding strategy that considers best management practices for debt management.

1. Capital Funding

Utilities can typically draw funds for capital projects from a variety of sources:

- Grants
- Developer contributions
- System Participation Fees
- System Reinvestment Funding
- Direct Funding from Rates
- Other Capital Revenues
- Debt

Given all of these potential funding sources, utilities often find themselves having to choose between funding sources when establishing a capital financing plan. While grants and developer contributions would logically be applied to project costs first, the next choice in the funding "hierarchy" is not necessarily apparent.

The specific decision regarding whether to fund projects by cash or debt is an important policy decision that will likely be driven by a number of considerations. Cash funding might be cheaper in the long-run because there is no interest, but debt funding could be the more practical option since it allows for the payment of project costs over an extended period of time. In addition, using debt to spread the cost over time will help ensure that future customers pay for their fair share of system costs.

Finding the appropriate balance of cash / debt financing requires an evaluation of debt management policies discussed below.

2. Debt Management

The City does not have a formal debt management policy, but historically has funded capital projects through a combination of "pay-as-you-go" cash funding (cash reserves, system participation fees, rates) and debt issuance. Excessive use of debt is unfavorable for a utility, and can damage the utility's credit rating, reducing its ability to acquire low-cost debt in the future. On the other hand, "pay-as-you-go" funding might create excessive burdens for existing customers, raising questions of practicality and equity between current and future customers.

Industry standards (and bond underwriter's preference) suggest that municipalities should maintain a debt-to-equity ratio (total debt divided by the sum of total debt and equity) of no greater than 50% debt and 50% equity (cash). The City's current debt-to-equity ratio for each utility are as follows: Water Utility - 1% debt / 99% equity; Sewer Utility - 54% debt / 46% equity; Stormwater Utility - 10% debt / 90% equity.

The rate management strategy presented for this rate study presumes the City will fund its capital programs first, with available capital cash resources (generated from SPFs, system reinvestment funding, and transfers from the operating account in excess of minimum balance thresholds) and next with the use of debt. As a point of reference, capital programs are forecasted to be funded over the six-year study period as follows: Water Utility - 29% debt / 71% cash; Sewer Utility - 44% debt / 56% cash; Stormwater Utility - 57% debt / 43% cash - well within debt management best practices.

F. CUMULATIVE IMPACT OF FISCAL POLICIES

Satisfying all of these policy objectives might seem daunting at first, but the outcome is that multiple benchmarks overlap, resulting in the simultaneous achievement of multiple objectives within the same level of rates. For example, the cash requirement for system reinvestment funding through rates may assure adequate debt service coverage, while also helping to maintain an appropriate debt-to-equity ratio.

Each criterion provides a different perspective on how much revenue is appropriate, and satisfying them all generally results in a higher rate than if only a single standard is considered. However, this approach reduces financial risk and increases financial stability — any near term increases that result will help to ensure more stable, and lower, long-term rates.

Section 3 System Participation Fees

A connection charge or system participation fee (SPF), as provided for by RCW 35.92.025, is a charge imposed on new development as a condition of connection to the utility systems or when increasing the capacity of an existing connection. In general, the purpose of an SPF is to mitigate the impact of growth on the utility systems, or to compensate for investments already made to provide available capacity to serve future growth.

A. METHODOLOGY

Revenues generated from SPFs can be used to directly fund capital projects or to pay debt service incurred to finance capital projects - but <u>can not</u> be used to pay operating and maintenance costs.

There are several documented approaches used in the industry to establish SPFs. Within the range of legally defensible approaches, the choice of the costs the City targets is a matter of policy. It is important, however, that the City follow a methodical and rational approach to consistently determine and implement cost-based SPFs. To that end, this study used the approach that combines elements of the "equity" method and "incremental" method for calculating the charge (described in the *American Water Works Association Rates and Charges, M1 Manual*). In short, this approach is based on the original cost of non-contributed plant investment, plus planned capital improvement projects (excluding replacements), spread over the total customer base (existing and future).

A description of the components included in the calculation of the charge (calculated for the Water and Sewer utilities only) follows.

1. Existing Cost Basis

Utilities most often design and build infrastructure with the capacity to serve more customers than are currently connected to the system. The existing cost basis component of the SPF is intended to recover an equitable share of the current system(s). Legal interpretations of connection charge statutes have provided guidelines for SPFs, which suggest that such charges should reflect the actual original cost of the utility system and can include interest on that cost at the rate of interest applicable at the time of construction (up to a 10-year period, not to exceed 100 percent of the construction costs). This cost is net of donated facilities and non-utility cash payments, whether from grants, developers or through Local Improvement District assessments. This method most accurately reflects what utility customers paid for the system. Until future customers connect to the system, existing customers will have to cover the costs of "excess capacity" available to serve growth. This obligation essentially represents a loan from existing customers to

future customers. Given this, it is reasonable to expect that future customers will pay for their share of costs when they connect to the system, plus interest.

Though not required, some municipalities deduct outstanding debt principal from plant-in-service in recognition that some assets were debt financed. Cash should be netted against the outstanding debt liability for this calculation since cash is an asset generated by existing customers that could be used to buy down existing debt on the system, and thereby reduce debt service payments for all customers. This "net debt" deduction serves to reduce the SPF to better reflect "equity" in the system, and to avoid double charging if new customers will pay their share of debt service through user rates.

Plant assets (net of contributed assets) used in the calculations were derived from the City's fixed assets listings as of December 31, 2008, plus current construction-work-in-progress. Outstanding debt and cash balances were also provided by City staff through debt service schedules and other financial documentation.

2. Future Cost Basis

The future cost basis component of the SPF is intended to recover a fair share of the costs of planned future capital facilities that will serve new customers. Legal interpretations also suggest that the "cost of the system" can include a component for future improvement costs to serve growth, as well as regulatory system improvements (planned for construction and identified in comprehensive system planning documents). Projects directly funded by grants, developer contributions or assessments are not included in the calculation. Repair and replacement projects are most often excluded from the calculation unless needed to upgrade or increase the size of the system, including upsizing of existing mains. The original costs of those assets are already included in the existing cost basis. Further, as a new customer connects and becomes an existing customer, they will pay for their share of repair and replacement project costs through user rates. Double charging would occur if those costs were also recovered in the future cost basis.

In the absence of specific regulation for cities, the planning horizon of the CIP to be used in the calculation is debatable. The key consideration in determining an appropriate planning horizon is to maintain consistency between the capital construction (and related costs) that will be incurred and the system capacity that will be available to serve growth commensurate with that capital construction. For calculation of the City's SPFs, a 6-year CIP was used, which is expected to provide system capacity for growth through the year 2014.

3. Customer Base / System Capacity

The customer base used in the calculation of the charge is typically expressed in terms of equivalent residential units that can be supported by the system capacity. This concept charges customers based on the potential demand that they will place on the system(s). As stated above, The City engineer provided calculations for the amount of capacity the existing and planned system infrastructure together will

serve. This calculated customer base is 10,424 ERUs for the Water Utility and 5,284 for the Sewer Utility.

4. Calculation of Charges

The sum of the existing cost basis and the future cost basis is divided by the customer base to determine the maximum allowable SPF. The calculated charge represents the maximum allowable charge - the City may choose to implement a charge at any level up to the calculated charge. Revenues generated, as well as equity achieved, will vary depending upon whether or not the full SPF is implemented (e.g., phase-in strategies). The lower the charge and longer the phase-in period, the less revenue will be collected and available to help pay capital-related costs.

It is important to note that the calculated SPFs are expressed in terms of current dollars. In other words, the calculated charges will only recover an equitable share of costs from new customers connecting to the system in the first year of implementation. A customer connecting in the following year should pay a SPF that reflects the cumulative system investment at the time they connect. Relative to the calculated (2009) SPFs presented herein, this would include:

- Assets added to the system during 2009
- An extra year of interest accrued
- Updated costs for the capital improvement program and construction-workin-progress

Given these considerations, the calculated charges would not recover a fair share of costs from customers connecting in subsequent years. The City could potentially address this concern in several ways:

- Recalculate the charges annually,
- Build a provision for inflation into the connection charges, or
- Compute SPFs in current dollars and adjust annually for inflation (recommended approach).

Calculating the SPFs annually is the most accurate method, but might not be practical given the amount of effort required. FCS GROUP recommends that the City adopt a policy for annual inflationary adjustments to the calculated charges, based on established sources, such as the *Engineering News Record's* "Construction Cost Index" (ENR CCI). This practice facilitates both appropriate cost recovery and increased equitability.

B. RESULTS

Results of the SPF analysis for each utility are summarized in this section. Additional detail identifying specific assets and eligible capital projects (or portions of projects) is provided in the Technical Appendices.

1. Water Utility

The City's current water system participation fee is \$2,754 per equivalent residential unit (ERU), where one ERU is equal to a ¾-inch meter. The data sources and assumptions relied on in the calculation of the updated SPFs are described herein.

As of year end 2008, water utility system assets equal \$13.6 million, including construction-work-in-progress and net of contributed assets. Ten years of interest accumulation totaling \$7.4 million was added to the cost basis. Finally, since the outstanding debt principal is less than the existing cash reserves, no outstanding debt principal was deducted. The resulting existing cost basis totals \$21.0 million.

The City has planned for about \$8.2 million (current day dollars) of capital projects over the next 6 years. About \$3.7 million of this total is for repair and replacement projects, which are excluded from the cost basis. The remaining \$4.5 million in future upgrade/expansion projects forms the future cost basis.

The total cost basis (existing plus future) for the SPF is \$25.5 million.

Based on utility billing system records, the water utility currently has 3,158 meter capacity equivalents. Based on data given by the City Engineer, the system capacity is 10,424 ERU's, adding 7,266 future ERU's to the existing total.

A 2009 water SPF of \$2,447 per meter capacity equivalent (3/4-inch meter) is derived by dividing the total cost basis by the total customer base. The charge increases by meter size based on the *American Water Works Association* (AWWA) meter capacity ratios.

Exhibit 3-1: Schedule of Water System Participation Fees

| Meter Size | | | Exis | sting | g | | | F | Proposed |
|------------|---------------|---------|--------------|-------|-----------|----|-----------|-----|-----------|
| Weter Size | Single Family | | Multi-family | Co | ommercial | ı | rrigation | All | Customers |
| 3/4" | \$ | 2,754 | \$ 4,515 | \$ | 5,692 | \$ | 4,498 | \$ | 2,447 |
| 1" | | 6,885 | 11,287 | | 14,231 | | 11,245 | | 4,086 |
| 1 1/2" | | 13,770 | 22,575 | | 28,462 | | 22,490 | | 8,148 |
| 2" | | 22,033 | 36,120 | | 45,539 | | 35,984 | | 13,042 |
| 3" | | 44,066 | 72,241 | | 91,079 | | 7,198 | | 26,109 |
| 4" | | 68,854 | 112,876 | | 142,311 | | 112,450 | | 40,791 |
| 6" | | 137,708 | 225,753 | | 284,623 | | 224,901 | | 81,558 |
| 8" | | | | | | | | | 130,498 |

2. Sewer Utility

The City's current sewer system participation fee for Winslow area customers only is \$5,123 per dwelling unit for residential customers. The data sources and assumptions relied on in the calculation of the updated SPFs are described herein.

As of yearend 2008, sewer utility system assets equal \$19.7 million, including construction-work-in-progress and net of assets serving SD7 Customers only and contributed assets. Ten years of interest accumulation totaling \$4.9 million was added to the cost basis. Finally, outstanding debt (net of existing cash balances) of \$11.6 million was deducted. The resulting existing cost basis totals \$13.1million.

The City has planned for about \$16.4 million (current day dollars) of capital projects over the next 10 years. About \$5.1 million of this total is for repair and replacement projects and about \$5.0 million is for assessment-funded future projects, which are excluded from the cost basis. The remaining \$6.3 million in future upgrade/expansion projects forms the future cost basis.

The total cost basis (existing plus future) for the SPF is \$19.4 million.

Based on utility billing system records, the sewer utility currently has 4,100 equivalent customers in the Winslow Area. Based on WWTP BOD capacity, the total customer base will total 5,284, adding 1,184 ERUs to the existing customer equivalents.

A 2009 sewer SPF for the Winslow service area of \$3,670 per meter capacity equivalent (3/4-inch meter) is derived by dividing the total cost basis by the total customer base. In addition, based on the existing ratio between the SPF per ERU and the SPF per multi-family residential unit, the 2009 SPF per MFR is \$2,277.

Section 4 Revenue Requirements

The revenue requirement analysis forms the basis for a long-range financial plan and multi-year rate management strategy for each utility. It also enables the City to set utility rate structures that are rooted in the "costs-of-service" and which fully recover the total costs of operating each utility: capital improvement and replacement, operations, maintenance, general administration, and fiscal policy attainment. Linking utility rate levels to a financial plan such as this helps to enable not only sound financial performance for the City's utility enterprises, but also, a clear and reasonable relationship between the costs imposed on utility customers and the costs incurred to provide them the service.

A. METHODOLOGY

When FCS GROUP conducts a revenue requirement analysis – the financial plan for each utility – it includes the following core elements, which together, form a complete portrayal of the utility's financial obligations:

- Capital Funding Analysis Defines a strategy for funding the utility systems' capital improvement programs including an analysis of available resources from rate revenues, system participation fees, debt financing, and any special resources (e.g., grants, developer participation, etc.).
- Operating Forecast Identifies future annual non-capital costs associated with the operation, maintenance, and administration of the utility systems.
- Sufficiency Testing Evaluates the sufficiency of utility revenues in meeting all obligations, including cash uses such as operating expenses, debt service, capital outlays, and reserve contributions, as well as any coverage requirements associated with long-term debt.
- Strategy Development Designs a forward-looking strategy for adjusting utility resources to fully fund all utility obligations on an annual or periodic basis over the forecast period.
- Reserve Analysis Forecasts cash flow and fund balance activity in utility reserves. Tests for satisfaction of recommended minimum fund balance policies (as discussed in Section 2 – Policy Development).

From this foundation, utility rate structures can be adjusted to meet the defined annual and long-term funding targets, as well as the City's pricing objectives.

The financial plans were developed for a six-year planning horizon — calendar year 2009 through 2014. The approach used for each core element of the financial plan is described below.

1. Capital Projects and Funding

The capital funding analysis aims to identify the costs of capital projects and summarizes funding sources available to help meet those costs. In other words, total sources of funds must at least equal capital expenditures and provide for the targeted level of capital reserve funding.

The first step is to estimate current day costs of capital improvements and replacement needs over the study period. City staff provided a listing of annual capital improvements and replacement needs over the study period. These capital projects were provided in year of construction dollars to account for construction costs increasing over time. Inflation rates used for to escalate these construction costs averaged about 3.7% per year over the study period.

With the system's capital needs defined, the next step is to identify the sources of funding available to help the City meet those needs. Potential sources include grants, developer contributions, reimbursements and capital reserves (including system participation fee revenues and system reinvestment funding). Debt can be issued to cover any costs not met by these other funding sources.

The capital financing strategy developed for this rate study utilizes the City's preferred hierarchy of funding sources, as follows:

- Capital project needs are first funded with available capital cash resources generated from system participation fees, system reinvestment funding from rates, transfers from the operating account, and interest earnings on capital account balances.
- Capital needs not met from the above cash resources will be funded with debt. The City will regularly pursue low-cost state loans, but unless approved at the time of planning, the financing strategy will assume the issuance of revenue bonds.

Debt service payments are assumed to begin in the year debt is issued. Current financing terms assume a 20-year repayment period; 4.5% rate of interest; 1.5% issuance cost; and debt service coverage of 1.25 including SPF revenues.

2. Operating Forecast

The operating forecast focuses on annual expenses incurred to operate, maintain, and manage the utility systems. The forecast used in this study is based on the calendar year 2009 operating budget (plus adjustments provided by City staff to incorporate known or estimated future expenditures for some line item categories).

Operating and maintenance (O&M) costs generally go up over time due to inflation. Historical general cost inflation has averaged about 3.1 % over the last five years. A

¹ Bureau of Labor Statistics, All Urban Customers, "Consumer Price Index", Seattle- Tacoma area, September 2004 through August 2009.

_

general inflation rate of 2.5% per year was used for this study. Salary costs escalation is also assumed at 2.5% per year, with a onetime addition of 3.5% in 2010 to account for furlough removal. Employee benefits escalation is assumed at a slightly higher rate of 5% to recognize historical cost increases above the rate of general inflation. Variable costs such as chemicals, printing, and postage costs are forecasted to increase with the size of the customer base in addition to inflationary impacts.

3. Revenue Needs Assessment

After forecasting the complete array of obligations facing the utilities, those costs are compared to forecasted revenues — comprised primarily by rate revenues — at their current levels. Rate revenues are increased over the forecast period by the amount of incremental rate revenues presumed to be generated from potential growth in the service areas.

When comparing utility obligations with available resources, we have examined sufficiency from two perspectives: cash sufficiency and debt coverage sufficiency.

- The "Cash Test" focuses on cash resources against cash obligations. Cash resources in this test include rate revenue, miscellaneous operating revenue, and interest earnings in the Operating Account. Cash obligations include operating expenses, debt service, system reinvestment funding from rates, direct rate funding of capital projects, and any contributions to the Operating Account to achieve minimum balance thresholds. If these cash obligations exceed resources available, a rate increase is required to fully fund the needs of the utilities.
- The "Coverage Test" refers to the ability of the utilities to meet debt covenants (or established internal policies) which require utility revenue streams to satisfy a specific margin. The coverage test evaluates revenues and expenses somewhat differently than under the cash test. For the coverage test, obligations include operating expenses (net of internal utility taxes), revenue bond debt service, and incremental debt service coverage (25% of annual revenue bond debt service). In addition to the revenues included in the cash test, the coverage test allows for the inclusion of interest earnings from all utility accounts (operating account, capital account, and any restricted reserve accounts), and often allows for annual system participation fee revenues (included for this study). This test does not allow for the use of cash reserves in meeting annual coverage obligations.

In determining the revenue requirements, both the cash and coverage sufficiency tests must be met. If a rate revenue deficiency exists under both tests, the analysis adds the greatest deficiency to the forecasted rate revenue. This yields the total rate revenue requirement for any given year. The analysis uses the revenue requirement to indicate system-wide annual rate revenue adjustments for each utility and to drive the cost of service analysis.

B. RESULTS

Results of the revenue requirement analysis for each utility are summarized in this section. Additional detail can be viewed in the Technical Appendices (e.g., detailed listings of capital projects, budgeted revenue and expense line items, inflows and outflows of fund balances, etc.).

1. Water Utility

The water utility financial plan includes a capital funding strategy, operating forecast, revenue needs assessment, rate management strategy, and reserve analysis.

Capital Funding Strategy

Over the six-year forecast, the water system faces a total of \$8.5 million (inflated) in capital program costs: an average of \$1.4 million per year. Of this six-year total, 46% is related to replacement projects and 54% is related to system improvements and upgrades (detailed project lists are included in the technical appendix).

The capital funding plan presumes that the capital program will be funded through a combination of capital cash resources and debt issuance. Based on our analysis, 82.2% (\$7 million) of the total capital program can be funded with current cash reserves, SPF revenue collections, planned annual contributions for system reinvestment funding, and transfers from the operating account. Next, 17.5% of capital needs are assumed to be funded with revenue bond proceeds (\$1.5 million), in the years 2011 and 2013. The remaining 0.3% of the capital needs is funded by outside sources. Exhibit 4-2 summarizes annual planned capital expenditures, along with assumed funding sources.

Exhibit 4-2: Water Capital Projects and Funding Sources

| Capital Funding | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 |
|---|---------------|-----------------|-----------------|---------------|---------------|---------------|
| Total Capital Projects | \$ 653,357 | \$ 2,458,766 | \$ 2,879,642 | \$ 862,465 | \$ 865,062 | \$ 792,388 |
| Outside Sources | 25,119 | - | - | - | - | - |
| Revenue Bond Proceeds | \$ - | \$ - | \$ 1,429,875 | \$ - | \$ 63,002 | \$ - |
| Use of Capital Fund Balance [a] Direct Rate Funding | 628,238 | 2,458,766 | 1,449,767 | 862,465 | 802,060 | 792,388 |
| Total Funding Sources | \$ 653,357 | \$ 2,458,766 | \$ 2,879,642 | \$ 862,465 | \$ 865,062 | \$ 792,388 |
| Ending Fund Balance | \$ 429,067 | \$ 1,449,767 | \$ 1,167,506 | \$ 802,060 | \$ 793,728 | \$ 547,600 |
| Minimum Target Balance | \$ 149,894 | \$ 156,427 | \$ 181,015 | \$ 209,811 | \$ 218,436 | \$ 227,087 |

[a] Includes annual System Participation Fee revenues and system reinvestment funding

It should be emphasized that this capital funding strategy presumes implementation of the system reinvestment funding policy at the level described in Section 2 – Policy Development, and implementation of the proposed level and use of system [participation fees as described in Section 3 – System Participation Fees. Furthermore, any changes in the amount of planned annual capital expenditures could impact this strategy.

Operating Forecast

EXPENSES

Over the six-year planning horizon, the water utility's total operating expenditures are forecasted to range from \$1.7 million to \$2.0 million per year (inclusive of inflation effects). The annual forecast is provided in Exhibit 4-3. In addition to O&M expenditures, existing and new annual debt service payments are forecast over the planning horizon. Existing debt service payment schedules were provided by City staff, with a \$123,000 payment in 2009. Future years' debt service incorporates impacts of the capital funding strategy. Incremental debt service incurred to finance the capital program will begin in 2011 at about \$182,000 and reaching \$212,000 per year by the end of the study period.

REVENUES

Water operating revenues are categorized as rate revenues and non-rate revenues. The revenue forecast relied on a combination of historical expenditures, budgeted line items, customer growth, and cost escalation. The annual forecast is provided in Exhibit 4-3. In summary:

RATE REVENUES UNDER EXISTING RATES:

The forecast of rate revenues under the existing level of rates reflect actual 2008 billing system and financial records, plus estimated customer growth over the study period. City staff provided estimated customer growth of 0.50% from 2009 to 2010, increasing to 1.00% in 2011 through the end of the study period.

The rate revenue under existing rates also includes a ramping up of revenue from School District #303, consistent with the current Inter-local between the City and the District. In 2009, revenues from the school district (under excising rates) are forecast at about \$6,200, reaching approximately \$125,000 by the end of the study period.

NON-RATE REVENUES:

Non-rate revenues include meter connection/inspection fees and road and street maintenance services. The forecast of non-rate revenues relies on the 2008 budget, escalated in proportion to customer growth, general cost inflation, or some combination depending upon the type of revenue.

Revenue Needs Assessment

The water utility faces \$14.2 million in total cash obligations over the six-year planning period, including operating expenses; existing and new debt service; system reinvestment funding; and contributions to reserves. Rate revenues — under existing levels — and other available revenues (excluding the use of cash reserves) are forecasted at \$14.3 million over the same time period - yielding a deficit of \$418,000 over the next six years. Based on our review, it appears that the City has historically

relied on cash reserves and/or SPF revenue collections to help pay annual operating expenses (inclusive of debt service payments). As these reserves are drawn down and growth continues to slow, rate increases are required to meet the current and forecasted annual financial obligations of the water utility.

The cash test drives this revenue deficiency. Given the level of cash needs above operating expenses (primarily driven by system reinvestment funding and debt service on loans), additional coverage above cash needs is not required. To eliminate this cash deficiency, rate revenues would need to increase about 3.92% above current levels, cumulative over the study period.

Exhibit 4-3 provides a summary of water utility revenue requirements over the study period.

Exhibit 4-3: Water Revenue Requirements Analysis

| Revenue Requirements | | 2009 | | 2010 | | 2011 | | 2012 | | 2013 | | 2014 |
|---------------------------------------|-----|-----------|-----|-----------|----|-----------|----|-----------|----|-----------|----|-----------|
| Revenues | | | | | | | | | | | | |
| Rate Revenues Under Existing Rates | \$ | 2,225,128 | \$ | 2,254,951 | \$ | 2,302,180 | \$ | 2,349,633 | \$ | 2,397,311 | \$ | 2,445,217 |
| Non-Rate Revenues | | 51,714 | | 56,823 | | 61,327 | | 66,300 | | 67,276 | | 68,881 |
| Total Revenues | \$ | 2,276,842 | \$ | 2,311,774 | \$ | 2,363,507 | \$ | 2,415,933 | \$ | 2,464,587 | \$ | 2,514,098 |
| Expenses | | | | | | | | | | | | |
| Cash Operating Expenses | \$ | 1,706,661 | \$ | 1,767,655 | \$ | 1,813,498 | \$ | 1,860,037 | \$ | 1,907,889 | \$ | 1,957,557 |
| Existing Debt Service | | 122,894 | | - | | - | | - | | - | | - |
| New Debt Service | | - | | - | | 182,006 | | 182,006 | | 212,481 | | 212,481 |
| Rate-Funded System Reinvestment | | 231,470 | | 365,724 | | 344,719 | | 403,614 | | 409,849 | | 428,371 |
| Additions to Operating Reserve | | | | 52,517 | | <u>-</u> | | | | | | - |
| Total Expenses | \$ | 2,061,026 | \$ | 2,185,896 | \$ | 2,340,223 | \$ | 2,445,657 | \$ | 2,530,219 | \$ | 2,598,410 |
| Annual Surplus / (Deficiency) | \$ | 215,816 | \$ | 125,878 | \$ | 23,284 | \$ | (29,723) | \$ | (65,632) | \$ | (84,312 |
| Net Revenue from Rate Increases | \$ | - | \$ | - | \$ | - | \$ | 29,723 | \$ | 65,632 | \$ | 84,312 |
| Net Surplus / (Deficiency) | \$ | 215,816 | \$ | 125,878 | \$ | 23,284 | \$ | - | \$ | - | \$ | 0 |
| Annual Rate Adjustment | | 0.00% | | 0.00% | , | 0.00% | | 1.42% | | 1.65% | | 0.80% |
| Cumulative Rate Adjustment | | 0.00% | 1 | 0.00% |) | 0.00% | | 1.42% | | 3.09% | | 3.92% |
| Rate Revenues After Rate Increase | \$ | 2.225.128 | \$ | 2.254.951 | \$ | 2.302.180 | \$ | 2.383.041 | \$ | 2,471,079 | \$ | 2,539,980 |
| Net Cash Flow After Rate Increase | • | 215,816 | 7 | 178,395 | * | 23,284 | 7 | 0 | 7 | (0) | 7 | 0 |
| No of Days of Cash Operating Expenses | | 50 | | 88 | | 90 | | 88 | | 85 | | 83 |
| Coverage Ratio After Increase | n/a | | n/a | - | | 3.94 | | 4.13 | | 3.70 | | 3.81 |

Reserve Analysis

A presumed interest earning rate of 2.0% is applied to annual beginning cash balances in the Operating and Capital Accounts. Operating interest is used to help pay annual operating expenditures, while capital interest is used to offset annual capital expenditures.

The cash balance in the water Operating Account is projected to increase to \$413,000 by year end 2014 (consistent with the recommended policy of 60 to 90 days of O&M expense).

The Capital Account balance is projected to decrease from \$3.7 million at the beginning of 2009 to \$548,000 by year end 2014 (well within the recommended reserve level of 1% to 2% of fixed assets).

2. Sewer Utility

The sewer utility financial plan includes a capital funding strategy, operating forecast, revenue needs assessment, rate management strategy, and reserve analysis.

Capital Funding Strategy

Over the six-year forecast, the sewer system faces a total of \$17.2 million (inflated) in capital program costs: an average of \$2.9 million per year. Of this six-year total, 88% is related to replacement projects and 12% is related to system improvements and upgrades (detailed project lists are included in the technical appendix).

The capital funding plan presumes that the capital program will be funded through a combination of capital cash resources and debt issuance. Based on our analysis, 60% of the capital needs are funded through additional draws on existing loans and through an interfund loan from the Water Utility. Next, 20% (\$3.5 million) of the total capital program can be funded with current cash reserves, SPF revenue collections, planned annual contributions for system reinvestment funding, and transfers from the operating account. The remaining 44% of capital needs are assumed to be funded with revenue bond proceeds (\$7.6 million), in the year 2010. Exhibit 4-4 summarizes annual planned capital expenditures, along with assumed funding sources.

Exhibit 4-4: Sewer Capital Projects and Funding Sources

| Capital Funding | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 |
|--------------------------------------|-----------------|-----------------|---------------|---------------|---------------|---------------|
| Total Capital Projects | \$ 7,020,009 | \$ 8,727,409 | \$ 271,630 | \$ 591,692 | \$ 216,042 | \$ 336,069 |
| Assessments, Grants, Contributions | 3,903,125 | 4,597,234 | - | _ | _ | - |
| Revenue Supported G.O. Bond Proceeds | - | 4,130,175 | - | - | - | |
| Use of Capital Fund Balance | 116,884 | - | 271,630 | 591,692 | 216,042 | 336,069 |
| Total Funding Sources | \$ 4,020,009 | \$ 8,727,409 | \$ 271,630 | \$ 591,692 | \$ 216,042 | \$ 336,069 |

It should be emphasized that this capital funding strategy presumes implementation of the system reinvestment funding policy at the level described in Section 2 – Policy Development, and implementation of the proposed level and use of system participation fees described in Section 3 – System Participation Fees. Furthermore, any changes in the amount of planned annual capital expenditures could impact this strategy.

Operating Forecast

EXPENSES

Consistent with the water utility, sewer operating expenses are categorized into six categories: salaries & wages; benefits; supplies; other services & charges; intergovernmental; and interfund expenditures. Over the six-year planning horizon, the utility's total operating expenditures are forecasted to range from \$2.1 million to \$2.4 million per year (inclusive of inflation effects). The annual forecast is provided in Exhibit 4-5. In addition to O&M expenditures, existing and new annual debt service payments are forecast over the planning horizon. Existing debt service payment schedules were provided by City staff, with annual payments of just under \$1 million per year. Future years' debt service incorporates impacts of the capital funding strategy. Incremental debt service incurred to finance the capital program will begin in 2009 at about \$643,000 per year through the end of the study period.

REVENUES

Sewer operating revenues are categorized as rate revenues and non-rate revenues. The revenue forecast relied on a combination of historical expenditures, budgeted line items, customer growth, and cost escalation. The annual forecast is provided in Exhibit 4-5. In summary:

RATE REVENUES UNDER EXISTING RATES:

The forecast of rate revenues under the existing level of rates reflect actual 2008 billing system and financial records, plus one year of customer growth and an 8.15% rate increase. City staff provided estimated customer growth of 0.5% per year for 2009 and 2010, increasing to 1.0% in 2011 through the end of the study period. In addition, rate revenues included those from SD7 customers with and without grinder pumps.

NON-RATE REVENUES:

Non-rate revenues include ULID Assessment revenues, which are used to pay PWTF debt service on South Island Sewer LID. Annual revenues are set equal to the PWTF debt service plus an additional 0.5% for administrative costs.

Revenue Needs Assessment

The sewer utility faces \$23.3 million in total cash obligations over the planning period, including operating expenses; existing and new debt service; system reinvestment funding; and contributions to reserves. Rate revenues — under existing levels — and other available revenues (excluding the use of cash reserves) are forecasted at \$18.7 million over the same time period - yielding a deficit of \$4.6 million over the next six years. Similar to the water utility, the City has relied on cash reserves and/or SPF revenues to help pay annual sewer operating expenses (inclusive of debt service payments). As these reserves are drawn down and growth

continues to slow, rate increases are required to meet the financial obligations of the sewer utility.

The cash test drives this revenue deficiency. Given the level of cash needs above operating expenses, additional coverage above cash needs is not required. To eliminate this cash deficiency (with the use of cash reserves), rate revenues would need to increase about 34% above current levels, cumulative over the study period.

Exhibit 4-5 summarizes sewer utility revenue requirements over the study period.

Exhibit 4-5: Sewer Revenue Requirements Analysis

Reserve Analysis

A presumed interest earning rate of 2.0% is applied to annual beginning cash balances in the Operating and Capital Accounts. Operating interest is used to help pay annual operating expenditures, while capital interest is used to offset annual capital expenditures.

The cash balance in the sewer Operating Account is projected to reduce from \$820,000 at the beginning of 2009 to \$503.000 by year end 2014 (consistent with the recommended policy of 60 to 90 days of O&M expense).

The Capital Account balance is projected to increase from \$371,000 at the beginning of 2009 to \$502,000 by year end 2014 (well within the recommended reserve level of 1% to 2% of fixed assets).

3. Storm Utility

The storm utility financial plan includes a capital funding strategy, operating forecast, revenue needs assessment, rate management strategy, and reserve analysis.

Capital Funding Strategy

Over the six-year forecast, the water system faces a total of \$3.4 million (inflated) in capital program costs: an average of \$562,000 per year. Of this six-year total, 100% is related to system improvements and upgrades (detailed project lists are included in the technical appendix).

The capital funding plan presumes that the capital program will be funded through a combination of capital cash resources and debt issuance. Based on our analysis, 32% of capital needs are can be funded using the capital fund balance (\$1.9 million). Next, direct rate funding in 2009 covers 10.6% of the capital needs. The remaining 57% of the capital program (\$1.7 million) will be funded using revenue bond proceeds, in the years 2010 and 2012. Exhibit 4-6 summarizes annual planned capital expenditures, along with assumed funding sources.

Exhibit 4-6: Storm Capital Projects and Funding Sources

| Capital Funding | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 |
|--------------------------------------|---------------|---------------|---------------|---------------|---------------|---------------|
| Total Capital Projects | \$ 569,364 | \$ 915,616 | \$ 514,232 | \$ 436,624 | \$ 515,569 | \$ 418,319 |
| Assessments, Grants, Contributions | 212,052 | 15,000 | - | - | - | - |
| Revenue Supported G.O. Bond Proceeds | - | 900,616 | - | 169,028 | - | - |
| Use of Capital Fund Balance | - | - | 514,232 | 267,596 | 515,569 | 418,319 |
| Direct Rate Funding | 357,312 | - | - | - | - | - |
| Total Funding Sources | \$ 569,364 | \$ 915,616 | \$ 514,232 | \$ 436,624 | \$ 515,569 | \$ 418,319 |

It should be emphasized that this capital funding strategy presumes implementation of the system reinvestment funding policy at the level described in Section 2 – Policy Development, and implementation of the proposed level and use of system participation fees described in Section 3 – System Participation Fees. Furthermore, any changes in the amount of planned annual capital expenditures could impact this strategy.

Operating Forecast

EXPENSES

Over the six-year planning horizon, the utility's total operating expenditures are forecasted to range from \$1.7 million to \$2.0 million per year (inclusive of inflation effects). The annual forecast is provided in Exhibit 4-7. In addition to O&M expenditures, existing and new annual debt service payments are forecast over the planning horizon. Existing debt service payment schedules were provided by City staff, decreasing from \$98,000 in 2009 to \$54,000 in 2014. Future years' debt service incorporates impacts of the capital funding strategy. Incremental debt service

incurred to finance the capital program will begin in 2010 at about \$98,000 and reaching \$150,000 per year by the end of the study period.

REVENUES

Storm operating revenues are categorized as rate revenues and non-rate revenues. The revenue forecast relied on a combination of historical expenditures, budgeted line items, customer growth, and cost escalation. The annual forecast is provided in Exhibit 4-7. In summary:

RATE REVENUES UNDER EXISTING RATES:

The forecast of rate revenues under the existing level of rates reflect actual 2008 billing system and financial records, plus one year of estimated customer growth, and a 3.4% rate increase. City staff provided estimated customer growth of 0.50% from 2009 to 2010, and increasing to 1.00% in 2011 and 2.00% in 2013 through the end of the study period.

NON-RATE REVENUES:

Non-rate revenues include a DOE grant in 2009 of \$50,000 for system mapping/NPDES requirements, and a Health District grant totaling \$91,000 in 2009 and 2010.

Revenue Needs Assessment

The storm utility faces \$13.8 million in total cash obligations over the six-year planning period, including operating expenses; existing and new debt service; system reinvestment funding; and rate funded CIP. Rate revenues — under existing levels — and other available revenues (excluding the use of cash reserves) are forecasted at \$14.1 million over the same time period, therefore covering the cash needs.

Exhibit 4-7 provides a summary of stormwater utility revenue requirements over the study period.

Exhibit 4-7: Storm Revenue Requirements Analysis

| | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 |
|---------------------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Revenues | | | | | | |
| Rate Revenues Under Existing Rates | \$ 2,274,894 | \$ 2,286,269 | \$ 2,309,131 | \$ 2,332,223 | \$ 2,378,867 | \$ 2,426,444 |

| Debt Service as a % of Annual Revenue | 4.32% | 6.65% | 6.56% | 8.72% | 8.52% | 8.33% |

Reserve Analysis

A presumed interest earning rate of 2.0% is applied to annual beginning cash balances in the Operating and Capital Accounts. Operating interest is used to help pay annual operating expenditures, while capital interest is used to offset annual capital expenditures.

The cash balance in the storm Operating Account is projected to increase from - \$11,000 at the beginning of 2009 to \$461,000 by year end 2014 (consistent with the recommended policy of 60 to 90 days of O&M expense).

The Capital Account balance is projected to increase from \$0 at the beginning of 2009 to \$236,000 by year end 2014 (well within the recommended reserve level of 1% to 2% of fixed assets).

Section 5 Cost of Service Analysis

The purpose of a cost of service analysis is to provide a rational basis for distributing the full costs of utility service to each class of customer in proportion to the distinct demands they place on the system. Detailed cost allocations, along with appropriate customer class designations, help to sharpen the degree of equity that can be achieved in the resulting rate structure design. A detailed cost of service was performed for the Water and Sewer Utilities only.

A. METHODOLOGY

The cost of service analysis was performed for a selected "test year," corresponding to the year in which new rates will take place. In this case, we used calendar year 2010, with proposed rates planned to be implemented January 1, 2010. Consistent with industry practice, the cost of service analysis includes the following components:

- Functional Cost Allocation Apportions the annual revenue requirement for the selected test year by major function of utility service. For the water system, functional categories include customer, meters & services, base demand, peak demand, and fire protection.
- Customer Classification & Cost Allocation Allocates functional cost pools to classes of customers based on their unique demands for service, as defined by system planning documents, industry standards, and recorded user history (from billing system information). Identifies shifts in cost recovery by customer class from that experienced under the existing rate structures. Determines the amount of revenue to be recovered from each class of customer, linked to a proportionate share of costs required to service their demand. Determines whether new or revised classes are warranted, depending on characteristics obtained from detailed customer data and/or City goals for class equity.

Fire Protection Costs

The Washington State Supreme Court recently ruled (Lane vs. Seattle) that fire hydrant costs (and potentially all fire protection related costs) cannot be recovered through water rates. Under their logic, this is a general government service, the charges for which would be considered a tax, and must have statutory or voter approval. The court upheld "a solution" that an increase to the utility tax on the water utility to recover those costs is valid and within statutory authority.

Working with the City's engineer and most recent water system plan, FCS GROUP determined the portion of the water system financial operations attributable to fire hydrant maintenance and the provision of fire related services.

For informational purposes, the percentage increase needed in the current water utility tax to recover the stated fire protection costs has been calculated - should the City wish to move in that direction. However, as FCS GROUP does not practice law, we understand that the City will consult with its own legal counsel regarding the mechanism for cost recovery.

1. Functional Allocations

The cost of service analysis begins with a functional allocation of utility costs. The purpose of this allocation is to categorize the total annual rate revenue requirement of the utility into functions of service, which can then be examined for cost recovery according to the manner in which different classes of customers use or place demands on the system for those specific categories of service.

Allocation of Capital Costs

Capital related costs include debt service payments, system reinvestment funding, and a portion of additions/uses of cash reserves. The most common methodology for assigning the capital portion of the revenue requirement to functional components is to allocate such costs on the basis of each system's existing plant-in-service. The allocations for plant-in-service utilized documented engineering planning criteria from both the City of Bainbridge Island and industry standards. In allocating this utility plant-in-service, we used the City's fixed assets listing as of December 31, 2008, organized into major categories for each system.

Allocation of Operating Costs

Operating costs include O&M expenses and a portion of additions/uses of cash reserves. These costs are allocated to the functions based on a detailed review of line item categories, generally following the cost causation process used in the allocation of plant. For example, customer billing costs are allocated to the "customer" category; maintenance and engineering costs are allocated in proportion to total plant-in-service; administrative costs are allocated in proportion to all other costs, and so on.

2. Customer Class Allocations

Once the annual revenue requirement has been categorized into functional cost pools, each cost pool can be further apportioned to the classes of customers who use the utility system. First, existing customer classes need to be either affirmed or modified to more appropriately group like- users. To accomplish this, the characteristics and historical demands of each class need to be studied. Then, using those characteristics and demands, each functional cost pool is allocated to each customer class in a manner that reflects each group's use of (or demands on) the utility system. These allocations draw upon account data, historical usage data, or

system planning requirements. Ultimately, this element of the analysis defines the total annual revenue that should be generated from each customer class, in order to achieve a reasonably equitable system of cost recovery from rates.

Customer Usage Statistics

A key component in the distribution of costs to customer classes is testing the reliability and accuracy of customer statistics. This is accomplished through a review of historical billing system data and application of the rate schedule in effect for that year. City staff provided historical billing system records for 2008, including number of accounts and dwelling units, size of meters, and monthly water usage. The total revenue generated from these customer statistics should approximate the actual revenue receipts shown in the financial statements (with minor differences due to the timing of new connections / disconnects, delinquencies, etc.). If the revenue estimates are with reasonable limits, statistics are determined "valid" and an adjustment factor is applied to the statistics if necessary to account for any minor discrepancies.

Further, customer usage statistics are evaluated to determine if current customer class designations represent an appropriate grouping of customers, or if revisions are warranted to better reflect customer groupings that exhibit similar usage patterns. This addresses rate equity among customer classes.

Distribution of Costs

The functionally allocated system-wide costs are distributed to the customer classes to determine "cost shares" based on the relative demands placed on the system by each class. This analysis identifies shifts in cost recovery by customer class from that experienced under the existing rate structure. Through this process, if one customer class places a higher or lower proportional average demand in one functional category, that customer class pays a higher or lower portion of that functional category's costs.

B. RESULTS

Results of the cost of service analysis for each utility are summarized in this section. Additional detail can be viewed in the Technical Appendices (e.g., detailed cost allocations, customer statistics, etc.).

1. Water Utility

The water utility cost of service analysis includes a functional allocation and a customer allocation.

Functional Allocation

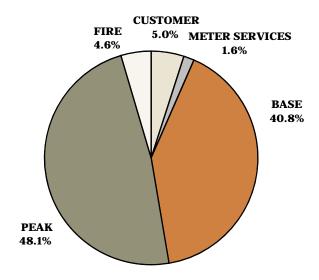

The rate revenue requirement for the water utility for year 2009 is projected to be \$2.3 million. Using the approach described above, the revenue requirement was

allocated to water service functional categories. Exhibit 5-1 illustrates the breakdown of water utility costs among these functional categories:

- Customer These costs are associated with services that do not vary by water consumption, including utility billing, meter reading, and office support.
- Meters & Services These costs are associated with installation, maintenance, and repairs of meters and services.
- Base Demand These costs are associated with the utility's ability to deliver water for average annual levels of demand. These costs tend to vary with the amount of water consumption, such as source of supply, chemical, and power.
- Peak Demand These costs are associated with the utility's ability to deliver water during periods of peak consumption, such as summer period irrigation.
- Fire Protection These costs are associated with the water system's delivery
 of direct fire protection, including the duration and flow rate of water used
 for fire suppression.

Exhibit 5-1: Allocation of Water Revenue Requirement to Functional Components

This distribution was developed using the following assumptions:

The water system's ratio of peak day demand to average day demand is 2.2, as documented in the City of Bainbridge Island Winslow Water System Plan.

- This ratio was used to allocate demand-related costs between base and peak demands and for allocations to pumping.
- Allocation of storage facilities is based on storage capacity dedicated to operations, equalizing, emergency (standby) and fire suppression functions as documented in the City's water system plan update. Fire storage was set to zero, due to nesting in standby storage.
- Allocations to transmission & distribution (T&D) facilities are first allocated to fire protection, and then to the base and peak components. In order to allocate the correct percentage to the fire protection component, a pipe analysis was performed, with guidance from City staff, to determine the percentage for the City's water pipe related to oversizing for fire protection. The resulting percentage from this pipe analysis, shown in Exhibit 5-2, was 11.66%. The remaining costs are assigned to base and peak demand using the ratio of peak to average day demand.
- Meters & services costs are directly assigned to the meters & services functional component. Hydrant costs are directly assigned to fire protection, and general plant is allocated in proportion to all other infrastructure costs.
- Operating & maintenance costs are allocated based on a detailed review of line items, such as salaries, office and operating supplies, chemicals, power costs, etc., and assigned to functions based on assumed cost causation.

Exhibit 5-2: Water Pipe Analysis

| | | Donlagoment | | Incremental | |
|-------|-------------|---------------------------|---------------|-----------------------------|--------------------|
| Pipe | Length (If) | Replacement Cost perl If. | Total Cost | Cost for Fire Oversizing | Notes: |
| 1 | 3 () | | | <u> </u> | Distribution <=8 |
| 2 | | | | | Distribution <=8 |
| 3 | | | | | Distribution <=8 |
| 4 | 10,095 | \$ 130 | \$ 1,312,350 | | Distribution <=8 |
| 6 | 32,590 | \$ 160 | \$ 5,214,400 | \$ 977,700 | Distribution <=8 |
| 8 | 71,610 | \$ 185 | \$ 13,247,850 | \$ 1,790,250 | Distribution <=8 |
| 10 | 7,090 | \$ 215 | \$ 1,524,350 | \$ 212,700 | Transmission => 10 |
| 12 | 42,030 | \$ 230 | \$ 9,666,900 | \$ 630,450 | Transmission => 10 |
| 14 | | | | | |
| 16 | | | | | |
| 18 | | | | | |
| 20 | | | | | |
| 24 | | | | | |
| 30 | | | | | |
| Total | 163,415 | | \$ 30,965,850 | \$ 3,611,100 |] |

After netting non-rate revenues from expenditures, and scallocating fire protection costs, the net revenue requirement to be recovered from water rates (\$2.2 million) is allocated to the functional categories as follows: 5.2% to customer; 1.7% to meters & services; 42.7% to base demand; and 50.4% to peak demand.

Customer Allocation

The City's customers are classified as: single family residential; multi-family residential; commercial; other; government; government – commercial; government – commercial: school district (interlocal agreement); irrigation; irrigation – government; irrigation – government: school disctrict (interlocal agreement); and hydrant. Furthermore, the City's current rate structure includes a 50% discount (on both fixed and volume charge) for those classified as low-income senior customers, and a multiplier of 1.08 for Rockaway residents.

In analyzing these customer classes, comparing actual service requirements and demand patterns and relying on industry practices, FCS GROUP condensed the customer classes into four classifications: single-family residential, multi-family residential, commercial/other, and irrigation. The City's current discount for l as low-income seniors and multiplier for Rockaway customers was maintained.

The average use per customer is derived from detailed 2008 customer billing statistics and can be found in the water spreadsheet model, Customer Summary Page 30. Results are as follows:

- All customers: 278,823 total usage / 2,405 total accounts /12 months = 9.7 ccf
- Single family: 151,796 total usage / 1,999 total accounts / 12 months = 6.3 ccf
- Multi-family: 55,800 total usage/95 total accounts / 12 months = 49 ccf
- Multi-family: 55,800 total usage / 1,476 total dwelling units / 12 months = 3.2 ccf
- Commercial: 60,191 total usage / 247 total accounts / 12 months = 20.3 ccf
- Irrigation: 11,036 total usage / 64 total accounts / 12 months = 14.3 ccf

Water system functional cost pools were distributed to customer classes using the demographics described below. Exhibit 5-2 illustrates the result of this process:

- Customer Accounts This statistic relates simply to the number of accounts in each customer class. Customer-related costs are allocated to customer classes based on their proportional share of total system number of accounts.
- Meters & Services Equivalents (MSEs) This statistic relates to the number and size of meters included in each customer class. The American Water Works Association (AWWA) has developed a meter service equivalency factor that reflects relative costs for different size meters, using the smallest meter as the baseline. Meters & services costs are allocated to customer classes based on proportional shares of total system MSEs.
- Annual Water Usage This statistic relates to total water usage consumed by the customer classes within a year. Total annual consumption, as

- Peak Water Usage This statistic relates to water usage consumed by each customer class within the system's peak period. The peak season is defined as August through October billing records. Average monthly consumption over the peak period, derived from the 2008 customer statistics, is equal to 34,798 ccf. This recognizes the increased water consumption primarily caused by outdoor irrigation. Peak demand costs are allocated to customer classes in proportion to total system peak season water usage by class.
- Meter Capacity Equivalents (MCEs) This statistic also relates to the meter size included in each customer class. A meter capacity equivalency factor has been developed by the AWWA that reflects maximum potential flow for different sized meters. Fire Protection costs are allocated to customer classes based on proportional shares of total system MCEs.

Exhibit 5-3: Distribution of Costs to Water Customer Classes

| Allocation Factor: | Customer | Meter & Services | Base | Peak |
|---|------------------------------------|------------------------------------|-------------------------------------|-------------------------------------|
| Allocation Basis: | Number of Meters | Meter Service Equivalents [a] | Annual Usage | Peak Season Usage [b] |
| Single Family Residential Multi-Family Residential Commercial / Other Irrigation | 83.13% 3.95% 10.25% 2.67% | 75.68% 8.02% 12.83% 3.47% | 54.44% 20.01% 21.59% 3.96% | 57.53% 15.45% 18.79% 8.23% |
| TOTAL | 100.00% | 100.00% | 100.00% | 100.00% |

[[]a] Based on AWWA meters & services cost ratio

The respective percentages are applied to the total costs allocated to each functional component (shown in Exhibit 5-1) to determine the share of total costs assigned to each class.

Exhibit 5-3 summarizes the customer class distribution of the \$2.3 million in revenue required from water rates in 2010. The cost of service analysis has identified that some shifts in cost burden amongst the customer classes is warranted.

[[]b] Based on August - October billing records

[[]c] Based on AWWA meter capacity ratios

Exhibit 5-4: Comparison of Water Revenue Distribution by Customer Class

| Customer Classes | | Revenue under rrent Rates | 10 Cost of Service | Cost of Service Increase / (Decrease) |
|---|----|--|--|---|
| Single Family Residential Multi-Family Residential Commercial / Other Irrigation | \$ | 1,183,922 411,404 534,616 125,009 | \$ 1,304,403 376,061 438,427 136,059 | 10.18% -8.59% -17.99% 8.84% |
| TOTAL | \$ | 2,254,951 | \$ 2,254,951 | 0.00% |

Under the current rate structure, the multi-family residential customer class (as a whole) and customers classified as commercial/other are paying more than their share of cost of service; thereby subsidizing the single family residential and irrigation customer classes. This finding suggests that a shift in cost recovery amongst customer classes would result in a more equitable rate structure than that currently in effect.

2. Sewer Utility

The sewer utility serves two different customer groups: Winslow customers and SD7 customers. The City only provides collection service for SD7 customers; treatment is not provided. Therefore, rates must be designed separately for these two customer classes. In line with industry practice, rates for SD7 customers were designed based on the split between treatment assets compared to collection assets.

O&M costs were first allocated to the treatment function in proportion to current plant assets and planned capital improvements. First, the portion of current plant assets and planned CIP projects related to treatment was calculated, by functionally categorizing each asset / capital project. This percentage (40.9%) was applied to total O&M costs. This resulted in approximately \$900,000 (of the total \$2.2 million) of 2010 O&M costs relating to treatment.

The remaining O&M costs (\$1.3 million) are thus related to the collection portion of the utility service. This provided the cost basis common to all sewer customers (both Winslow Way and SD7 customers). This cost basis divided by the total number of customer ERUs and then divided by 12, results in a monthly rate for SD7 customers. With an ERU basis of 4,339, the SD7 unit cost per month is \$25.06. In addition, the costs for grinder pump maintenance and grinder pump replacement funding were used to calculate the incremental unit costs for customers with grinder pumps (\$18.06).

SECTION 6 RATE DESIGN

The rate design element focuses on constructing rate structures, including fixed and variable rate components, for each class of customer to recover the appropriate amount of revenue from each class of customer and to recover the revenue necessary in total to fully fund utility financial obligations. Further, City pricing objectives regarding affordability, equity, and conservation are applied.

A. METHODOLOGY

Prior to this section, our findings rested on financial and technical analyses to derive the total annual revenue need from each utility and the amount that should be collected from each customer class. In this section, we focus more on the art of a utility rate study, which is the design of the pricing structure itself. Much of this rate design focuses on intended outcomes that — carry out desired public policy, such as affordability to the customer, equity considerations, and administrative practicality. The rate design begins with an evaluation of the City's current rate structures. Alternative rate structures are recommended, as warranted, to better achieve the City's desired outcomes.

1. Water Rate Structure Evaluation

The rate structure evaluation reviews the existing water rate structure and presents proposed changes for the City's consideration.

Existing Rate Structure

The City's existing water rate structure consists primarily of two components: a minimum monthly charge (fixed charge) that increases by meter size and a block rate structure used to determine the volume charge per 100 cubic feet of water consumption applicable to all residential, multi-family, commercial, and other customers. There is only one volume charge for all meter sizes for irrigation systems. The City offers a discounted fixed and volume charge (roughly 50% of the regular rate) to qualified single family residential low-income seniors. Finally, a separate schedule of city rates applies for Rockaway Beach customers.

Exhibit 6-1 presents the existing water rate structure.

Exhibit 6-1: Existing Water Rate Structure

[a] Includes Government customers

Based on the cost of service analysis, it appears that the current rate structure recovers a disproportionately high share of costs from the commercial/other class and from the multi-family residential customers, and too low a share of costs from single-family and irrigation customers.

Proposed Rate Structure

Based on the results of the cost of service analysis and discussions with City staff, the following alternative water rate structure was designed:

FIXED CHARGES

Design of class-specific minimum monthly charges that increase with the size of meter. This charge recovers customer related costs, meters & services costs, and a portion of peak demand costs. The following components are included:

 Customer related costs that do not vary by customer class or with the size of meter were assigned a ratio of 1.0, meaning the portion of the charge related to customer costs is the same for all customer classes and all meters sizes.

- Meters & services cost, such as the cost of assembly, repair and maintenance of meters and services were assigned Meter Service Equivalent (MSE) ratio, based on the ratios documented in the AWWA Rates and Charges Manual (M1). The ratio is the same for all customer classes, but increases with each larger meter size in relationship to its cost compared to that of the smallest meter.
- The portion of peak demand costs (currently established at 45% of peak demand costs) included in the monthly charge was assigned the Meter Capacity Equivalent (MCE) ratio, again based on the ratios documented in the AWWA M1 manual. Similar to the MSE ratio, this ratio increases with each larger meter size. This component of the charge also varies by customer class incorporating the differing peak demands of each class.

WATER USE CHARGES

Class-specific usage-based charges, designed to recover all base demand costs and the remaining portion of peak demand costs (currently established at 55% of peak demand costs):

- Single Family Residential (SFR) A four-tiered increasing block rate, where the rate per unit of consumption increases above each established threshold of usage; thus, both the incremental and average cost of water to the consumer increases with increased usage. The intent of this rate structure is to promote water conservation (or at least to charge appropriately for peak use). Since the SFR class represents the largest portion of total system water usage and has relatively high peak demands on the water system, it is reasonable to target this class for water conservation.
- Multi-Family Residential (MFR) and Commercial/Other A class-specific seasonal usage charge, where a single rate per unit of consumption is applied to all units of consumption depending on the season.
- Irrigation A single rate per unit of consumption is applied to all units of consumption.
- Low Income Discount Maintain the City's existing discount policy.
- Rockaway Beach Customers Maintain the City's existing outside City multiplier of 1.08 times inside City rates.

2. Sewer Rate Structure Evaluation

No change was made to the Sewer Utility's existing rate structure. The existing rate structure contains a separate schedule for both Winslow Way and SD7 customers.

Winslow Way customers are grouped into a "metered rate" or "flat rate" category. The customer groups within those categories are as follows: Single Family Residential, Multi-family Residential (metered rate category only) and Non-

Residential. As in water, low-income seniors receive a 50% discount on both fixed and volume charges.

The City's existing Winslow Way sewer rate structure for metered customers consists of a class-specific monthly base rate and a volume charge per 100 cubic feet of water consumption. Multi-family customers pay a monthly rate per dwelling unit, whereas all other customers pay per account. The residential volume charge is applied to the lesser of actual water use or the winter cap. The volume charge for all other classes is applied to actual water usage. Flat rate customers pay a flat monthly charge per account. The City offers a discounted rate (50% of the regular) to qualified single family residential low-income customers.

SD7 customers pay flat rate per account each month. This includes a pass-through treatment charge as well as a City rate component that covers the collection portion of their service. Those customers with grinder pumps pay an additional amount every month to recover the maintenance and replacement costs associated with the grinder pump.

Exhibit 6-2 presents the existing sewer rate structure.

Exhibit 6-2: Existing Sewer Rate Structure

^[2] Residential sewer volumes based on actual water usage in 'non-summer months and winter average water usage in summer months; Non-residential volumes based on actual annual water usage

^[3] Includes SD7 Treatment Charge (\$40) and City rate component

Proposed Rate Structure

Based on the results of the cost of service analysis and discussions with City staff it was determined that the existing structure will be maintained with customer class rates adjusted in accordance with the cost of service results.

3. Stormwater Rates

The stormwater utility current charges all customers a monthly rate of \$12.89 per equivalent surface unit. Any future increases will be applied to this current rate.

B. RESULTS

Results of the rate design for each utility are summarized in this section. Additional detail can be viewed in the Technical Appendices.

1. Water Utility

The water utility rate design element includes the rate design and a comparison of customer bill impacts under proposed rates against existing rates.

EVALUATION OF BLOCK RATE THRESHOLDS

An evaluation of the City's current block rate structure was performed. In discussions with City staff, they emphasized that the City wanted to continue to send strong conservation signals through their volume rate structure.

An evaluation of the City's current blocks thresholds showed that these blocks are appropriate, based on the historical water usage patterns for the single family residential class. The following "rule of thumb" was used in the analysis:

 Block 1 (0-5 ccf per month) is set equal to average monthly winter period usage per account for the class. This is assumed to approximate normal indoor usage and a nominal amount of outdoor winter use. On an average

annual basis, about 62% of customer bills are expected to remain within this rate block threshold.

- Block 2 (5-12 ccf per month) is set roughly equal to two times average annual usage per account. This is assumed to capture the majority of base demand use and a reasonable amount for normal summer use (peak use). About 26% of customer bills fall into the second block.
- Block 3 (12-30 ccf per month) captures all water usage above the block 2 threshold and is designed to target higher summer use. The third block captures 9% of customer bills.
- Block 4 (over 30 ccf per month) captures all water usage above the block 3 threshold and is designed to target higher the top 3% 5% of water usage.
 The City's fourth block captures the remaining 3% of customer bills.

DETERMINATION OF BLOCK RATE DIFFERENTIALS

In order to further encourage conservation, the rates of each volume block were updated. Lower block (blocks 1 and 2) volume charges were reduced to reward low water users, while higher blocks (blocks 3 and 4) were increased to encourage conservation. The City might consider modifying these rate block differentials and/or the proposed block thresholds over time if desired conservation is not achieved.

Customer Bill Impacts

Extensive calculations of monthly water bill impacts for each class are presented in the Technical Appendix.

As an example, a single family residential customer using around the 6 ccf a month (approximately the "class average"), would experience a \$2.26 increase in their monthly bills (\$46.66 to \$48.92). As water use increases, the monthly bill impact increases.

2. Sewer Utility

As previously noted, a new sewer rate structure was not designed in this study. Class-specific cost of service adjustments were applied to the City's current rate structure. Proposed rates are shown in Exhibit 6-5.

The sewer utility rate design element includes the rate design and a comparison of customer bill impacts under proposed rates against existing rates.
